Logic Assignment # 4

Make a phone call

Step 1: After further review, the problem we are being asked is how can I use my cellular device to connect with contacts who are unavailable to be spoken with face to face

Step 2:

- Transaction level: Each number combined to make a phone number
- Beginning point of data: You need a cellular device to communicate
- We are collecting data (numbers) so we have people to call for any instance we can think of
- What do we need to know: Phone numbers, What application we use to call, how we call, where our call is going

Step 3:

- To make a phone call, I have identified the key components needed and I intend to retrieve this data from the contacts app located on my iPhone

Step 4:

- I need to collect every phone number I want to call and write down or memorize the number
- I need to put those numbers into the phone application to make a call
- I need to know how to commence the call
- I need to know where my call is going (i.e. mobile, home, fax, office)

Step 5:

- I want to make a phone call so, I am looking for the contacts applications so I can find the numbers of people who cannot be reached face-to-face, I memorize the numbers to put into the phone application so I can make the call, after putting in the numbers I need to hit some type of button to start the call, and lastly, once the phone starts ringing identify if this is a mobile line, home line or fax line

Step 6:

- I am phoning my partner's home line because I cannot talk to them in person. I need to open a special application that allows calls, I need a number to phone in then I can press the green button to call. The phone numbers are stored in a different application. I open the contacts and memorize their number. I then input their number into the call application and press the green button.

Step 7:

We were presented with the problem: How to make a phone call. Upon further review, we identified the actual problem which is how can we communicate with contacts who aren't available to be spoken to face-to-face.

To be able to communicate with your long-distance partner about a dinner recipe you saw, you need to figure out where their number is stored since that is how you can virtually communicate. After locating their number in the contacts application, you can transfer that to the phone application. Once you type that number in, you can hit the green button to place an outgoing call. Be sure to check if it's a mobile, home, or fax location you're calling to
