

Take out the trash

Identify the problem:

The trash has piled up and needs to be taken out before it starts to smell or overflow.

What do I need to know to answer the question: I need to know when the trash is full, what day the garbage gets picked up, and if there are any rules about what can go in the trash (like recycling, compost, or hazardous stuff). I also need to figure out where the trash cans are, how to tie the bags so they don't spill, and if I need help with any heavy bags.

Organize the data: The trash in the kitchen and bathroom is full, and garbage day is tomorrow. I need to separate the recyclables from the regular trash and make sure everything is in the right bag. I'll double-check the bags to make sure they're not too heavy to carry, and I'll make sure all the trash cans in the house are emptied before taking them out.

Find and identify the relationship:

Taking out the trash keeps the house clean and stops bad smells or pests from showing up. It's important to separate recyclables from regular trash, not overfill the bags, and take them out on time so things don't get messy.

Find a solution:

I'll grab all the trash bags from the kitchen, bathroom, and other rooms, making sure to separate recyclables from regular trash. I'll tie the bags tightly, so they don't spill, then take them outside to the bins before garbage day. If any bags are too heavy, I'll ask for help.

Present:

I'm going to take out the trash by grabbing all the full bags from the kitchen and bathroom. I'll make sure to separate the recyclables from the regular trash, tie up the bags tightly, and take them outside to the bins before garbage day tomorrow. This way, the house stays clean, and I won't have to deal with bad smells or overflowing trash.
